Idea & Goals
SreamIt
StreamGraph GUI

Idea & Goals

- Visualize parallel programming
- Graphical layer on top of a textual language

- StreamIt: subset representation

Introduction
Demo
Backend
Conclusion
Bibliography

Idea & Goals
Sreamlt
StreamGraph GUI

StreamIt

- Developed for streaming applications
- Pipeline-based structure

Base constructs

- Filter: "The Workhorse of StreamIt"; *work*-, *init*-functions
- Pipeline: linear succession of StreamIt constructs
- Split-Join: creating parallel paths
  - Split: split single data stream into multiple data streams
  - Join: join previously splitted streams together

For further information on StreamIt see [1].

Idea & Goals
Sreamlt
StreamGraph GUI

Parallelism in StreamIt

Split-Join

Splitting (or duplicating) of data:

- Paths independent between *split* and *join*

As result paths may be processed in parallel

Pipeline

Continuous data stream through filters:

- *Work*-functions are constantly recalculated.
- Filters can be processed independently.

Therefore filters in pipelines can be parallelised.

Idea & Goals
SreamIt
StreamGraph GUI

StreamGraph GUI

Visual abstractions of StreamIt toplogy

- Split & join integrated into filters
- Implicit pipelines

Introduction
Demo
Backend
Conclusion
Bibliography

Idea & Goals
SreamIt
StreamGraph GUI
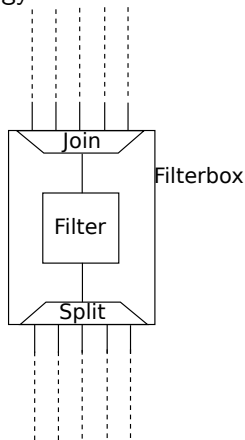

StreamGraph GUI

- Minimalistic and clear design
- Mouse control via pop-up menus
- Intuitive control

Elements

- Menu bar
- Working surface
- Notification bar
- Property window

Demo

DEMO: `demoPower.str`

Framework
Model
Graph Transformation
Code Generation

StreamGraph View

- Based on Gtk2::Ex::MindMapView [2]
- Gnome Canvas used as engine
- Item → border → content
- Handle keyboard and mouse events
- Many other changes

Introduction
Demo
Backend
Conclusion
Bibliography

Framework
Model
Graph Transformation
Code Generation

Model

Program structures modeled in two ways:
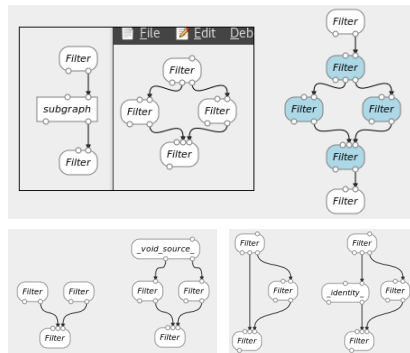

Graphical: *Node*

- Node types (*Filter*, *Subgraph*, *Parameter*, *Comment*)
- Factory

Textual: *CodeObject*

- StreamIt types (*Pipeline*, *Splitjoin*, *Parameter*)
- *CodeObject*s derived from *Node*s

Introduction
Demo
Backend
Conclusion
Bibliography

Framework
Model
Graph Transformation
Code Generation

Graph Transformation

- Load subgraphs
- Add void sources and -sinks
- Add identities for empty pipelines
- Test for graph errors

Introduction
Demo
Backend
Conclusion
Bibliography

Framework
Model
Graph Transformation
**Code Generation**

Code Generation

General procedure

- Generate code for all filters
- Build pipeline-based structure
- Generate code for topology in recursive manner

Filter generation

- Make name unique
- Get parameters
- Build *init*- and *work*- function

Code Generation

StreamIt pipeline-based structure

Introduction
Demo
Backend
Conclusion
Bibliography

Framework
Model
Graph Transformation
Code Generation

Code Generation

Building the structure

- Begin with pipeline (main)
- If split is detected start building of split-join
    Build a pipeline for every Path.
- Continue with generation of pipeline.

Indirect recursive method guarantees StreamIt-type hierarchical structure

Get the code by generating from inside out.

Results
Improvements & Future

Results

- Complete toolchain from "empty" to "running"
- Limited StreamIt representation
- Working prototype

Introduction
Demo
Backend
Conclusion
Bibliography

Results
Improvements & Future

Improvements

- Ordered splitjoin (currently only commutative use of results)
- More StreamIt constructs (e.g. message passing, feedback-loop)
- UI
  - Group-to-subgraph
  - In-graph error highlighting
  - Data visualization
  - ...
- More automatic compatability
- StreamIt+Java1.5+Perl-packages auto setup
- Code quality & style

Introduction
Demo
Backend
Conclusion
Bibliography

Results
Improvements & Future

Future

Possible research and development directions

- Different background language
- More general graphical environment
